

Project Overview

Project Name	Import Data using Transform Maps	Maximum Marks	2 Marks
Date	31 January 2025	Team ID	6ab615fddcdcae33acb38af6f

Customer Problem Statement Template

A customer problem statement describes a challenge from the point of view of the person who experiences it. It focuses the team on what matters, a useful and secure experience for people who work with imported employee training records, before any solution is chosen.

For this ServiceNow project, the statements cover two connected areas: **accurate data ingestion and reference resolution**, and **role-based security for sensitive training information**.

Project Description: A ServiceNow project implementing data import, dot-walking, user roles, and ACL-based access control to securely manage employee training records.

PS-1: Data Integration & Reference Resolution

PS-1 ServiceNow System Administrator	
I am	A ServiceNow System Administrator responsible for automated employee data ingestion and database integrity.
I'm trying to	Import legacy employee training CSVs accurately and resolve manager and department references dynamically through dot-walking.
But	The imported data can contain duplicate employee records and inaccurate parent manager references.
Because	The CSVs lack uniform unique keys, and the Transform Map coalesce and dot-walk or script logic may be configured incorrectly.
Which makes me feel	Frustrated and anxious about database pollution, corrupted reporting, and the extra hours needed for cleanup.

PS-2: Role-Based Data Security & Compliance

PS-2 HR Compliance & Operations Lead	
I am	An HR Compliance and Operations Lead overseeing sensitive employee performance metrics and security audit policies.
I'm trying to	Ensure that only designated HR administrators and managers can view sensitive employee training scores.
But	General or unauthorized users may be able to view or edit confidential training results.
Because	The custom training table needs appropriate table-level and field-level Read/Write ACL controls.
Which makes me feel	Vulnerable and stressed about privacy compliance and potential security-audit failures.

Problem Statement Summary

Problem	Customer	Core Need	Key Barrier
PS-1	ServiceNow System Administrator	Accurate employee training imports with reliable manager and department references.	Duplicate records and inaccurate reference resolution.
PS-2	HR Compliance & Operations Lead	Restrict sensitive training scores to authorized users through roles and ACLs.	Insufficient table-level and field-level access controls.

Consolidated Customer View

The project has two connected customer needs. Imported training data must stay accurate and correctly linked to employee information, and sensitive training results must be protected from unauthorized access. Together, these statements are the basis for the next brainstorming and prioritization of Transform Map, dot-walking, role, and ACL solutions.

How Might We: Problem Framing

PS-1	How might we import employee training data accurately into ServiceNow while resolving manager and department references through reliable dot-walking?
PS-2	How might we ensure that sensitive employee training records are accessible only to authorized users through appropriate roles and ACLs?

Impact if Unresolved

PS-1	Duplicate and mislinked records corrupt training reports, force manual cleanup, and reduce trust in the imported data.
PS-2	Exposed or editable scores create a privacy risk, can fail a security audit, and weaken confidence in the platform.

Success Measures and Ownership

How the team will know each problem is solved, and who is suggested to own the check. Owners and targets are proposals to be confirmed by the team.

Problem	Success Measure	Verification	Suggested Owner
PS-1	Zero duplicate records when the same CSV is imported twice	100% of rows resolve employee, manager, and department correctly	System Administrator
PS-2	Unauthorized test users cannot read or write the score field	Only HR administrators and managers can view training scores	HR Compliance Lead + Security / ACL Administrator

Expected Focus for the Next Ideation Step

Data Integration	Explore coalesce strategies, duplicate prevention, reference lookups, and dot-walking for employee, manager, and department relationships.
Security & Governance	Explore user roles, table-level ACLs, field-level ACLs, and dynamic access checks for sensitive training fields.
Validation	Consider import testing, error handling, reference integrity, and access validation before production use.

Key Risks to Carry Forward

Risk	Mitigation
Non-standard or missing employee IDs	Validate and clean IDs before import; reject blank keys.
Blank manager or department on user records	Check sys_user completeness first; flag empty dot-walked values.
ACL gaps or over-restriction	Test with both an authorized and an unauthorized user before go-live.
