

Project Name	Import Data using Transform Maps	Maximum Marks	4 Marks
Date	31 January 2025	Team ID	6ab615fddcdcae33acb38af6f

Understanding the User

An empathy map captures what we know about a user's behaviors and attitudes in one easy-to-read view. Building an effective solution starts with understanding the real problem and the person who experiences it. **User:** ServiceNow System Administrator / HR Operations team managing employee training imports.

WHAT DOES THE USER THINK & FEEL?

What really counts: Ensuring data integrity, preventing duplicate employee records, and maintaining accurate parent manager references.

Major preoccupations: Staging table errors, script failures during Transform Map execution, and security compliance.

Worries & aspirations: Anxiety over corrupted reporting and manual cleanup hours. Aspires to fully automated, reliable legacy data ingestion.

WHAT DOES THE USER HEAR?

- Management asking why employee records are disconnected from department managers.
- HR staff complaints about missing legacy training histories.
- Technical recommendations on using coalesce fields and dot-walking scripts.

WHAT DOES THE USER SEE?

- Raw legacy CSV spreadsheets with non-standard column headers.
- ServiceNow staging table warning logs and unresolved target sys_ids.
- Transform Map configuration interfaces and ACL rule lists.

WHAT DOES THE USER SAY & DO?

Attitude in public: Advocates rigorous data validation and adherence to security policies.

Behavior towards others: Collaborates with developers and compliance officers to define precise table-level and field-level access.

Actions taken: Runs dry-run imports in sub-production instances, writes source mapping scripts, and audits role assignments.

PAIN (fears, frustrations, obstacles)

- Duplicate employee profiles caused by improper coalesce settings.
- Unresolved manager references and unexpected staging errors.
- Risk of sensitive training data exposure due to weak ACLs.

GAIN (wants, needs, success metrics)

- Flawless automated data ingestion with zero manual post-import fixes.
- Reliable dot-walking that resolves complex department hierarchies.
- Secure, role-restricted access that safeguards confidential scores.

Key Insights for the Team

Core need	Trustworthy imports: no duplicates, correct manager and department links.
Core fear	Confidential training scores visible to unauthorized users.
Design implication	Pair coalesce and dot-walking setup with table and field ACLs from the start.
